Slide overview with speaker notes · 8 October 2026

Welcome to Day 3!

SPEAKER NOTES

Have this on screen while people walk in. Once everyone is seated, give a warm welcome back: keep it to a few sentences.

What do you remember from last week?

Without looking back, explain:

What are the steps of our working method?

What goes in CLAUDE.md, and what in settings.json?

What is a skill, and why make one?

What does MCP connect Claude to?

Where does the human stay in charge?

Answer from memory first, no peeking.

SPEAKER NOTES

Cold retrieval: make people answer without looking at last week's slides. Open one question per click and let the room answer before you add anything. The last question is the bridge to today: n8n is about workflows, and a good workflow has clear places where a person decides.

Today and tomorrow

From connected AI in one tool to workflows that connect many tools.

Today

What n8n is, why we use it, a tour, and your first workflow.

Tomorrow

We build on today's first workflow.

SPEAKER NOTES

High-level overview only: point at the route for today and say in one sentence what tomorrow builds on it. Details come on the following slides.

4**CONTEXT**

DAY 3 · TEAM

The team of Aetherlink

We are what we do.

Jessy The

Constance van der Vlist

Maarten Nauw

Ryan Lisse

SPEAKER NOTES

Name who from the Aetherlink team is here today and what they do, one sentence each. Remove anyone who isn't in the room.

5**CONTEXT**

DAY 3 · TEAM

Introducing myself

Who is teaching you n8n today.

Who I am

What I do

How I use n8n

SPEAKER NOTES

Introduce yourself: who you are, what you do, and one concrete thing you have built or automated with n8n. A real example of your own makes the next slides land better.

6**CONTEXT**

DAY 3 · WARM-UP

How many of you have ever worked with n8n?

SPEAKER NOTES

Ask it literally and let the hands go up; say roughly how many you see. Follow-up question: who has used another automation tool, like Zapier, Make or Power Automate? Those people will recognise the idea quickly. Use the answer to set the pace of the tour.

What is n8n?

A tool to build workflows: steps that run on their own, across the tools you already use.

A workflow

A chain of steps you draw on a canvas, from left to right.

A trigger

What starts it: a click, a schedule, a form, an email, a webhook.

Nodes

Each step is a node: read data, call an app, use AI, make a decision.

Connections

Hundreds of ready-made integrations, plus HTTP and code when you need more.

Something happens → n8n runs the steps → the result lands where you need it.

SPEAKER NOTES

n8n (say 'n-eight-n', short for 'nodemation') is a workflow automation tool. You build a workflow on a canvas: a trigger starts it, and each node after it does one step, like reading a spreadsheet, calling an app, asking an AI model or choosing a path with an IF. Data flows from node to node. It has hundreds of ready-made integrations, and when one is missing you use the HTTP Request node or a Code node. Keep the tagline as the one-line definition.

Why n8n?

Why use it at all, and why we use it in this programme.

Why use it

- You see the whole workflow on one canvas
- Little or no code, with code when you need it
- Can run on your own server, so data can stay in-house
- AI is one step in the flow, next to normal tools

Why we use it here

- It turns last week's method into a workflow that runs
- Skills, tools and checks become nodes you can see
- You decide where a person approves
- Your team can read it, reuse it and change it

AI does the steps. People decide where the workflow stops for a human.

SPEAKER NOTES

Left column: general reasons. It's visual, so anyone on the team can follow a workflow; it's low-code but lets you drop into JavaScript or Python when needed; it can be self-hosted, which matters for a company like Worldline where data should stay inside; and AI is just one node among normal integrations. Right column: why here. Last week ended with a workflow that chains skills, tools and a human checkpoint. n8n is where that becomes something that runs on its own and that the team can see, reuse and change.

A tour of n8n

The parts you will use today.

1. **Workflows** — Your overview: every workflow you have, active or not.
2. **Canvas** — Where you build: add nodes with +, connect them, drag them around.
3. **Trigger node** — Every workflow starts with one. Today: start it by hand.
4. **Node panel** — Open a node: input on the left, settings in the middle, output on the right.
5. **Executions** — Every run, with the data each node saw. This is where you look when something fails.
6. **Credentials and templates** — Log-ins for apps, kept separately; templates are ready-made workflows to start from.

SPEAKER NOTES

Do the tour live in n8n and use this slide as the order. Workflows overview; the canvas; add a Manual trigger; open a node and point at the three parts of the panel (input, settings, output), because reading input and output is the most important skill today; run it and show the Executions list with the data per node; finish on credentials (stored once, separate from the workflow, never pasted into a node) and templates as a place to start.

What can you create in n8n?

Explore n8n and build your first small workflow.

Ideas

a form that sends you a summary
a schedule that fetches data and saves it
an AI step that sorts incoming text
a flow that stops for your approval

STEPS:

1. Open n8n and create a new workflow.
2. Add a Manual trigger, then two or three nodes after it.
3. Run it. Open each node: what came in, what went out?
4. Open Executions and find your run.
5. Look at one template: what does it do, step by step?

Expected result A small workflow that runs, and you can explain what each node does with its data.

Timer on the slide: the facilitator types the minutes.

SPEAKER NOTES

Type the minutes on the timer and press start. Keep it small: a Manual trigger and two or three nodes is enough. Walk around and ask people to explain what data goes in and out of one node; that's the skill that matters. Early finishers: look at a template from the list and explain it step by step, or add an IF node with two paths.

What did you learn?

Complete these statements.

n8n is...

A workflow I could build for my team is...

The step where a person must decide is...

I still have a question about...

Quiet timer: 3 minutes

Complete each statement for yourself.

SPEAKER NOTES

Give three quiet minutes to complete the statements, then collect a few out loud. Write the workflow ideas and open questions on the flipchart: they are the starting point for tomorrow.
